

Match the words to the objects in the picture,
then think of a quick recipe you can make.
Write it in 3 short sentences as instructions for another person.

a. A jar of mayo
b. A cucumber
c. A pair of chopsticks
d. A head of lettuce

e. A bone-in steak
f. A loaf of bread
g. An avocado
h. Tomatoes

i. A kitchen knife
j. A glass bowl
k. A tin of tuna
l. A tablespoon

John isn't very good at cooking.
In fact, he's the kind of idiot who can't break two eggs without making a mess!
He has tried a couple of recipes, and you can see the results. The results are disgusting!
Rewrite the instructions clearly so even John can follow them!

Cut the lettuce, cucumber, tomatoes, and avocado into small pieces.

Mix the ingredients in the glass bowl and add a spoonful of mayo.

Stir with mayo and serve with slices of bread.

Open the tuna and mix it with a spoonful of mayo.

Chop the cucumber and one tomato, add them to the mixture, and stir well.

Spread the tuna salad on bread and make a sandwich.

- Watch the video and do quick **T/F** task:
1. Addison knows computers well.
 2. David explains the CPU.
 3. RAM keeps data forever.
 4. Addison enjoys the sandwich.
 5. Addison makes a cheese sandwich.
 6. David pretends to be a robot.
 7. Addison puts the bread back.
 8. A robot will clean up the mess.

- What is an **Algorithm**?

- a) Is a software program or mobile app used to play games or watch video streams.
- b) Is a digital storage folder of user data used to save a file or keep records.
- c) Is clear step-by-step instructions used to solve a problem or complete a task.

Living with Algorithms

We live in an algorithmic world where automated mathematical rules quietly serve as the invisible constitution of modern existence, shaping everything from our personal choices to global systems. Algorithms are no longer just cold snippets of computer code; they have evolved into the infrastructure of our culture, commerce, and cognition.

Review the arguments **for** and **against** daily algorithm use.

Which points are **positive**, and which are **negative**?

Listen to the podcast to verify your choices and find the reasons the speakers give for their views.

- Really? See, that's exactly what worries me.

1. They predict and manipulate our purchasing habits.
2. They streamline tedious and repetitive daily tasks.
3. They expand access to global knowledge resources.
4. They quietly automate major life decisions online.
5. They optimize critical health and safety systems.
6. They flatten cultural diversity and human creativity.
7. They serve as highly customizable personal tools.
8. They exploit psychology to maximize screen time.
9. They can be easily modified or deactivated.
10. They dictate what information we consume daily.

tedious (adj.) – boring because it takes a long time and is repetitive.
streamline (verb) – to make a process simpler, faster, and more efficient.
proprietary models (phrase) – systems or technologies owned by a company.
incentives (noun) – things that encourage or motivate people to do something.
transparency (noun) – being open and clear about how something works.
embedded (adj.) – fixed deeply into something or becoming an essential part of it.

- You know, the more I think about it, the more I realize **algorithms** are basically **running our lives** now.

- If an algorithm can predict your next purchase, your favorite song, and who you will vote for, do you actually have free will?

- Would you let an AI algorithm choose your romantic partner or your best friend if data proved it had a 99% success rate of making you happy? Why or why not?

- If you were offered \$5,000 cash right now, but the condition was deleting all

your social media accounts and never using a personalized algorithm again for one full year, would you take the deal?

- If your TikTok, Reels, or YouTube page became a physical person, would you want to be friends with them, or would they creep you out? Why?

- Think about a time an algorithm gave you a terrible recommendation (a weird song, an ugly outfit, or a bizarre video). Did you feel insulted that the computer thought you would like it?

- How would you feel if a robot algorithm – not a human – graded all your school essays and exams or the quality of your working task based entirely on data?
